

"GIS Analytics" Ltd. works with a full range of open source software products for creation, manipulation, analysis and visualization of spatial data as well as creation and provision of interactive maps and online GIS applications.

The design and implementation of a geographic information system (GIS) is a complex task, requiring profound knowledge in the field of geoinformatics and the field of application. GIS Analytics professionally supports each step in the design, implementation and use of open source software products during the conceptual, logic and physical system design.

Another aspect of the activities of the company is the conversion of geographic data from one format to another as well as training and education in the field of geographic information systems, geoinformatics, migration to open source software, etc.
